Njord Ionisation

Eliminate odour problems effectively using ionisation through natural and environmentally friendly static discharge.

Ionisation entails the formation of negative ions through static discharging, and the air passing through the air purifier is charged with electrons (the same phenomenon as when there is lightning).

This has a combative effect against microbes, such as viruses, bacteria and mould, both air-borne and those found on surfaces, but most of all it is very effective at eliminating odours.

The ionisation unit is installed inside the air purifier, ensuring that all the air that passes through it is treated, and it thus takes up no extra space.

Choose Njord Ionisation as a complement to your Njord air purifier when you want to eliminate bad smells and odours, e.g., in the garbage room and in industrial applications with processes that emit bad smells.

Characteristics:

- Quickly and effectively eliminates bad smells
- Has a combative effect against microbes
- Positive effect on health, mood and energy levels
- Increases the capacity of the air purifier filter as the particles clump together due to the static discharges
- Safe, discreet and silent

Technical Specifications:

Ioniser: Air Purifier XJ-2000 6W

 **Compatible with:** Njord XP-S / Njord XP-2 / Njord XP-4

Suitable for:

Foodstuffs industry / Garbage rooms / Waste and sewage systems / Plastic industry / Workshops

njordcleanair.com

Advantages:

- **Compatible with all Njord Air Purifiers**
- **Simple installation**
- **Installs inside the air purifier**
- **Natural and environmentally friendly**
