

We tailor air purification systems to solve our customers' problems

Even in extremely challenging environments and complex situations, we create solutions that are specially tailored to the premises and the unique conditions and air purification needs of the business.

Flexibility is one of our core principles and part of our DNA. We always work closely with our customers to understand their specific needs and then develop solutions that work optimally for their business. Whether the goal is to protect people, goods, advanced equipment, or processes, we tailor air purification systems to solve our customers' problems. Using our efficient industrial air purifiers as a foundation, we build air purification solutions customized to the conditions of the premises and the objectives to be achieved.

Our flexible air purifiers can be mounted on the ceiling, wall, or placed on the floor, and can be integrated with various systems for air distribution through different types of ducts and textile diffusers. They can be equipped with UV-C technology to eliminate microorganisms and ionization to address odor issues. In noise-sensitive environments, we can fit the air purifier with a silencer to reduce noise from the air purifier's air outlets. We can develop specific solutions to handle all types of air quality problems – regardless of complexity.
