#### CASE STUDY:

Ajas / Buchholz-Mendt, Germany

***“Njord’s air purifiers are powerful, reliable and energy-saving – an efficient and economical solution for our production.”***

During production, pollution inevitably arises from the release agents and varnishes used, and as the demand for colored components has increased, so has the pollution. Clean air is crucial for a pleasant and safe working environment, and for us, the health of our employees is a high priority. To create a better working environment, we have chosen Njords air purifiers, which are placed directly at the emission sources. Since installation, the air quality has improved significantly, which is also noticeable in the satisfaction of our employees.

Njords air purifiers are powerful, reliable and energy-saving. Mounted on the ceiling, they also reduce the need for heating because the already

heated air is cleaned and then distributed back into the premises, making the system both efficient and economical.

The ceiling-mounted solution is also space-saving and integrates perfectly into our workshop environment, which was a decisive advantage compared to other options. All air purifiers can be controlled individually via a central app, which gives full control over performance and makes it easy to adjust the airflow as needed. Njord’s customer service is customer-focused and flawless, and regular maintenance is handled automatically and reliably. We are very satisfied.

PUR in Form

Ajas is a family-owned company founded in 1967 and now run by the third generation. With extensive experience, we offer a complete solution – from consulting and manufacturing of production tools in our own workshop to the production of components in different colors and material combinations adapted to specific areas of application. Production takes place at two plants, where 16 machines manufacture PUR foam parts for customers in the leisure, medical, construction machinery and automotive industries.
